DERONE RANKIN

LEARNING EXPERIENCE DESIGN & AI ENABLEMENT PORTFOLIO

Los Angeles Area, CA | DeroneLRankin@aol.com | linkedin.com/in/dlrankinlosangeles

Learner-centered design • Online curriculum • Technology adoption • Facilitation • AI-enabled learning

PORTFOLIO NOTE Some work from school and organizational settings cannot be shared directly because it may contain proprietary, student, or internal information. Case studies below describe real work. Any recreated or newly designed samples are labeled as representative portfolio artifacts and contain no confidential learner data.

Profile

Learning experience designer and educator with 14+ years of experience building learner-centered curriculum, digital and blended learning experiences, assessments, professional learning, performance support, and technology-adoption programs. I translate complex material into clear learning journeys and use learner evidence, stakeholder feedback, and emerging tools—including generative AI—to improve outcomes.

Online & Async Design	Course Scoping	Learning Objectives
Assessments	Blended Learning	Adult Learning
SME Collaboration	Learning Analytics	Technology Adoption
AI-Enabled Design	Facilitation	Continuous Improvement

Case Study 1 - Schoolwide StudySync Implementation

AUDIENCE Secondary educators with varied levels of confidence using a new digital curriculum platform.

MY ROLE Professional Learning & Implementation Lead at TEACH Tech Charter High School; responsible for learning support across the implementation lifecycle.

Challenge

A schoolwide platform rollout required more than a one-time demonstration. Educators needed to understand the system, connect it to instruction, troubleshoot workflow questions, and build enough confidence to use it consistently.

Learning approach

- Identified implementation and capability gaps, then translated them into a practical rollout and support plan.
- Partnered with the principal, program director, educators, and subject-matter experts to gather needs, clarify workflows, and surface pain points.
- Built a blended support experience using live demonstrations, guided practice, collaborative problem-solving, job aids, quick-reference resources, assessments, coaching, and follow-up support.
- Reviewed platform data, assessment evidence, observation, implementation patterns, and educator feedback to revise sequencing, reinforcement, and support.

What this demonstrates

Needs Analysis	End-to-End Ownership	Facilitation
Performance Support	Stakeholder Partnership	Adoption Measurement

Case Study 2 - Blended & Asynchronous Curriculum Design

AUDIENCE Middle- and high-school learners with varied reading levels, prior knowledge, language needs, and technology readiness.

PLATFORMS Canvas, Schoology, Google Classroom, StudySync, SpringBoard, IXL, Newsela, and Khan Academy.

Challenge

Learners needed clear, structured digital experiences that could support different readiness levels while preserving rigorous learning goals. The design challenge was to make the path through content, practice, feedback, and assessment visible and usable—not simply move classroom materials online.

Learning approach

- Defined learning objectives and sequenced content from modeling to guided practice, independent application, assessment, and feedback.
- Created digitally delivered lessons, activities, scaffolds, examples, and assessments with attention to usability and learner independence.
- Used platform reporting, assessment results, observation, and learner performance to identify friction points and refine content, practice, and pacing.
- Served six consecutive years on middle- and high-school curriculum committees, contributing to needs analysis, curriculum/resource evaluation, assessment alignment, implementation planning, and continuous improvement.

EVIDENCE OF IMPACT Across broader curriculum-alignment work, performance improvements were associated with a 17% increase in tenth-grade ELA proficiency. The result is presented as an organizational outcome associated with the work, not as a claim that one learning asset caused the change.

What this demonstrates

Learner Journey Design	**Online Curriculum**	**Assessment Design**
Data-Informed Iteration	**Accessibility-Minded Scaffolding**	**Learning Technology**

Case Study 3 - AI-Enabled Learning Design Workflow

TYPE Representative portfolio case study based on my current hands-on AI workflow; not presented as a prior client deployment.

TOOLS ChatGPT and Claude for research, synthesis, scenario development, first-pass learning design, content drafting, workflow planning, and quality review—with human verification.

Design problem

Many teams need practical AI learning that changes work behavior, not a tour of terminology. The design goal is to help a non-technical learner identify an appropriate AI use case, communicate the task clearly to the tool, recognize limitations, and verify the result before using it.

Workflow

- Start with the performance task and define what the learner must be able to do at work.
- Use AI to accelerate research, scenario ideation, alternative explanations, and first-pass content structures.
- Apply human review for factual accuracy, context, audience fit, instructional sequencing, privacy, and responsible-use considerations.
- Design practice around realistic decisions and outputs rather than passive recall.
- Pair training with concise performance support so the learner can apply the behavior after the formal experience.

Sample artifacts included

- Better Prompts in 5 Steps - one-page performance-support job aid for non-technical AI users.
- Responsible Generative AI at Work - 12-minute asynchronous microlearning blueprint with objectives, scenario practice, assessment, and transfer support.

Design Principles

Begin with performance	Define what someone needs to do differently after the learning—not just what they need to know.
Make complexity usable	Translate technical or unfamiliar material into clear structures, examples, scenarios, and decisions.
Design for transfer	Pair learning with practice, feedback, and job support so capability survives after the session or module.
Use evidence to iterate	Treat assessment results, behavior, platform data, and feedback as signals for redesign.
Use AI with judgment	Let AI accelerate research and drafting while human review owns truth, context, privacy, and instructional quality.

Tools & Methods

Learning platforms: StudySync, SpringBoard, IXL Learning, Canvas, Schoology, Google Classroom, Newsela, Khan Academy. Productivity: Microsoft 365, Google Workspace. AI: ChatGPT, Claude. Measurement: platform reporting, assessments, spreadsheets, dashboards, observation, implementation evidence, learner and stakeholder feedback.

Education

- M.Ed., Curriculum & Instruction - University of Nevada, Las Vegas
- B.A., Speech Communication (Rhetorical Studies), Minor in English - California State University, Long Beach
- California Clear Single Subject Teaching Credential in English with English Learner Authorization
