MICROLEARNING BLUEPRINT

Responsible Generative AI at Work - 12-minute asynchronous module

Representative portfolio artifact - created to demonstrate online learning design, scenario-based practice, assessment, and transfer support.

AUDIENCE Non-technical employees who are beginning to use approved generative AI tools in everyday knowledge work.
PERFORMANCE GOAL Given a common work task, learners will decide whether AI is appropriate, create a useful prompt, and identify what requires human verification before the output is used.

Learning objectives

- Recognize three situations where generative AI can accelerate work and two situations requiring caution or escalation.
- Build a prompt using outcome, context, format, and quality constraints.
- Apply a verification checklist before using AI-generated content in a work product.

Experience map

Time	Element	Design
0:00-1:30	Hook + scenario	A project manager has 20 pages of meeting notes and a deadline in 30 minutes. Learner chooses how AI could help—and what it should not decide.
1:30-4:00	Concept: Use AI for the right work	Three patterns: summarize/synthesize, transform/structure, brainstorm/compare. Contrast with high-risk decisions, sensitive data, or unverified claims.
4:00-7:00	Guided practice: Build a prompt	Learner improves a weak prompt in four passes: outcome, context, format, quality rules.
7:00-9:30	Scenario challenge	Learner reviews an AI-generated draft containing one unsupported claim and one privacy risk, then selects the necessary corrections.
9:30-11:00	Knowledge check	Four questions: two scenario decisions, one prompt-quality item, one verification item. Immediate explanatory feedback.
11:00-12:00	Transfer	Download the Better Prompts in 5 Steps job aid and complete one real-work application this week.

Assessment and measurement

- Module completion and knowledge-check accuracy establish immediate learning evidence.
- A one-week pulse asks learners whether they applied the workflow and where friction remained.
- For an enterprise deployment, usage trends and recurring support questions would be compared with baseline behavior to identify where exposure has—or has not—become capability.

Design rationale

The experience moves from a recognizable work problem to a simple mental model, then into guided practice and a scenario requiring judgment. The job aid supports transfer after the module. The design deliberately treats AI literacy as a performance problem—not a vocabulary quiz.
